## Engineering Fomulas

## Belt Length Formula

Length $=$ Dia + Dia $\times 1.65+2(C D)$
$C D=\frac{\text { Length }-D+d(1.65)}{2}$
2

| FPM, VELOCITY = . $262 \times$ DIA X RPM |  | FPM/VELOCITY |
| :---: | :---: | :---: |
| $\text { RPM }=\frac{\text { FPM (Velocity) }}{.262 \times \text { Dia }}$ |  | RPM |
| $\text { Dia. }=\frac{\text { FPM (Velocity) }}{.262 \times \text { RPM }}$ |  | DIAMETER |
| $\mathrm{Hp}=\frac{\text { Force } X \text { Velocity }}{33,000}$ |  | HORSEPOWER |
| $H p=\begin{gathered} \text { Torque } X \text { RPM } \\ 63,025 \end{gathered}$ |  | HORSEPOWER |
| $\left.\begin{array}{c} \text { Force, } \\ \text { Torque }=\text { Pull, } \\ \text { Tension } \end{array}\right\} \times \text { Radius }$ |  | TORQUE |
| $\text { Torque }=\frac{\mathrm{Hp} \mathrm{X} \mathrm{63,025}}{\text { RPM }}$ |  | TORQUE |
| $\mathrm{EF}=\frac{\mathrm{Hp} \mathrm{X} \mathrm{33,000}}{\text { Velocity (FPM) }}$ |  | EFFECTIVE FORCE |
| $\mathrm{Te}=\frac{\mathrm{Hp} \times 63,025}{\text { RPM X Radius }}$ |  | $\begin{aligned} & \text { EFFECTIVE } \\ & \text { TENSION (Te) } \end{aligned}$ |
| $\mathrm{Te}=\frac{\text { Torque }}{\text { Radius }}$ | $\mathrm{Te}=\frac{\mathrm{Hp} \times 33,000}{\text { Velocity }}$ | $\begin{aligned} & \text { EFFECTIVE } \\ & \text { TENSION (Te) } \end{aligned}$ |

Please Note: Torque is in INCH LBS
